Removal of Lead Paint from Fire Hydrants

Officials required blasting and painting 230 hydrants in phase one, and 1,000 hydrants in phase two and three; other municipal hydrants, would be scheduled after the completion of phase three.

Silver Sponge Media™ abrasive was specified for the project based upon key process benefits:

- **Operator Safety** - The suppression of airborne lead particles was critical in the small containment system.
- **Cutability** - The process had to aggressively cut multilayered, 1.6 to 3.2 micron (40 to 80-mil), lead coatings and provide a surface profile.
- **System Mobility** - The system had to be mobile enough to fit down city and residential streets.

- **Quick Set-up and Clean-up** - Efficient site preparation and cleanup was necessary to blast and repaint ten hydrants per day.

The phase one contractor used the Sponge Blasting System, blasting and repainting eight to twelve hydrants per day. The phase two and three contractor initially used a large recycling-steel grit system, but switched to the Sponge Blasting System after damaging phone lines and landscaping with two, 12 meter (40-ft) trailers.

The contractor switched and used two small utility vehicles and a trailer to transport the Sponge Blasting System, a negative air and filtration system, an air dryer, an air compressor, and an SSPC Class One containment system. Using proper containment and maximum media recycles, Silver Sponge Media abrasive consumption and waste disposal costs were minimized.
School officials searched for a technology that could remove lead paint in the pool house at California Polytechnic State University (Cal Poly). Lead-based paint was peeling in the pool house, posing potential health risks to its users.

Cal Poly expected to use abrasive blasting, but harbored concerns for overall project safety, air quality, process leaching, and waste generation. The contractor chose the Sponge Blasting™ System, which responded to the school’s concerns, and offered a clear solution:

- **Dry and Easily Containable** - The Sponge-Jet technology offered a non-leaching, easily containable solution. Other wet, leaching blast technologies were impractical, or too costly to confine.

- **Low Airborne Dust** - Lead dust suppression was critical to limiting exposure to system operators as well as surrounding students and faculty.

- **Safe for Workers and Employees** - The process had to be safe to use with California’s stringent EPA air quality regulations.

- **Process Sensitivity** - The process had to be aggressive enough to offer efficient production rates, without damaging the concrete substrate.

The three-mil lead paint was successfully removed from the pool house’s walls and ceiling. Silver Sponge Media™ abrasive was safely recycled seven times, minimizing both waste disposal and total costs.

Cal Poly officials and the painting contractor enjoyed the hassle-free project, and the pool was quickly opened.

Problem: Surface preparation and repainting was required on 320m² (3,450 ft²) of structural steel in a Corpus Christi, Texas oil refinery. A prominent nationwide specialty contractor, was hired to remove failing lead paint and heavy rust on structural support beams throughout the refinery. The contractor’s challenges, defined by the refinery’s general foreman, were to allow nearby production units to continuously operate, and to maintain a dry, low dust environment.

Solution: Using Sponge-Jet’s Sponge Blasting System™, the contractor was able to prepare the surface to the SP6 specification in one dry, low dust process - allowing oil production to continue. These same qualities allowed painting to quickly ensue. The refinery and contractor were able to share a significant cost savings.

Goals:
- Low Dust
- Dry Process
- Low Ricochet
- Cost Efficient

Alternatives considered:
- High Pressure Water
- Sand Blasting
- Agriblasting
- Power Tooling

Contractor’s choice:
Sponge-Jet’s Sponge Blasting System™ Silver Sponge Media™

“Using the Sponge Blasting System the job came in under the quote we provided to the refinery’s general foreman.”

lead paint removal from shop ceilings and walls in an old textile mill

problem: 4,600m² (50,000 ft²) of lead painted ceilings and walls in a converted Manchester, NH textile mill were being sandblasted in preparation for a new coating system. Dust from conventional sandblasting began migrating to the mill’s lower levels, which were occupied by operating businesses. After the N.H. Department of Health determined that the migrating dust contained dangerously high levels of lead, MARCOR Remediation, Inc., a nationally recognized environmental contracting company, was hired to safely decontaminate the site using a clean, dry, low-dust process.

solution: Marcor Remediation used the Sponge-Jet Sponge Blasting System to remove the remaining 3300m² (35,000 ft²) of lead paint—yielding, on average, 45m² (480 ft²) per manday. Due to the clean, low-dust Sponge Blasting process, the MARCOR Remediation project manager noted that “our wipe samples verified lead levels well below HUD guidelines…and we finished in record time.”

### Airborne Contaminant Comparison

Test results from ESA Laboratories, Inc., Chelmsford, MA measured airborne lead concentrations when blasting with Sponge Media™ abrasives and silica sand abrasives. The test comparisons revealed blasting with Sponge Media™ abrasives reduced airborne lead concentrations by over 90%.
